

Vehicles Recommendation Web

universidad
de león

The Team:

- ★ Jimena Onrubia Álvarez
- ★ Andrés Martínez Colina
- ★ Ignacio Gil Rojo

1. Introduction

➤ Product Description

A web application that combines an intelligent conversational chatbot powered by Groq with visual filters to recommend the vehicle(s) on the market that best match your lifestyle, tastes, and personal preferences.

Allow you to select your favorites to save to your account and search for real purchase links on the web once you've made your decision.

➤ Problem Solved and Project Focus

How many times have you considered changing your car but had no idea where to start? With thousands of models, brands, specifications, and opinions available online, choosing the right vehicle can quickly become overwhelming.

This application is designed to simplify that process, whether you are an automotive enthusiast with advanced knowledge or someone who knows very little about cars.

You can explore vehicles using traditional filters and predefined criteria, alternatively, you can have a conversation with an intelligent recommendation system that helps you identify and understand your real needs.

The platform guides you through a personalized discovery process, translating your preferences and lifestyle into relevant vehicle recommendations. Once you've narrowed down your options, you can save your favorite vehicles to your account and even search for real purchase opportunities and listings available on the web.

The result is a faster, smarter, and more confident way to find the right car for you.

➤ Target Audience

Our platform is designed for anyone looking to purchase, replace, or better understand a vehicle, regardless of their level of automotive expertise.

2. Working Team

The project was developed through a collaborative effort in which all team members actively contributed to the implementation of the platform while also taking on specific responsibilities based on their strengths and areas of focus.

Jimena – Project Coordinator & Community Manager

Jimena was responsible for coordinating the team's work, assigning tasks, tracking progress, and ensuring that project milestones were met on time. In addition to her leadership role, she also contributed directly to the implementation and development of key platform features.

Andrés – Software Developer & Quality Assurance Lead

Andrés contributed to the implementation of the platform alongside the rest of the development team. Additionally, he took primary responsibility for testing activities, validating new features, identifying issues, and helping ensure the overall quality and stability of the application.

Ignacio – Software Developer & Documentation Lead

Ignacio participated in the development and implementation of his assigned components of the project. He was also responsible for preparing and maintaining project documentation.

➤ Development Methodology

The team followed an agile workflow based on short Scrum-style sprints. At the beginning of each sprint, Jimena defined the objectives, distributed tasks among team members.

Regular discussions and coordination were carried out through WhatsApp meetings and group conversations, where the team reviewed progress, resolved technical issues, clarified requirements, and adjusted priorities when necessary.

3. Project Requirements and Organization
